

# CAN YOU CENTRALLY MANAGE ALL MOBILE DEVICES IN YOUR COMPANY?

**The challenge:** The mobility of today's workforce and the wide variety of mobile device platforms available make control and management significantly more difficult.

The use of mobile devices in the business world is clearly on the rise. Not only that, according to The Times, with the appearance of smartphones and tablets the average number of mobile devices business executives use rose to 3.4 in 2012.

As if this was not enough, the existence of multiple mobile platforms competing for the same niche market has made network management even harder and fostered the appearance of fragmented management solutions with very different functionalities.

**The solution:** A single, cloud-based mobile device management solution for your entire organization.

Systems Management lets you manage your Android and iOS devices, both in the office and on the road, from a single Web-based console accessible anywhere, anytime.

Log software and hardware changes on mobile devices and generate reports on the status of your mobile fleet.
